

Prematurity Roadmap: Parent Information Session Looking After Little Lungs

What do we know about breathing in babies and children born preterm?

When: Tuesday, 24 July | 10am - 11am

Where: Live broadcast the MCRI Facebook page
www.facebook.com/MurdochChildrensResearchInstitute

Breathing problems are very common for babies born preterm because they are born before their lungs are fully developed. Babies born very early often need a lot of medical support for their breathing while they are in hospital. These children may be more at risk of lung infections and asthma as they grow up.

The Centre of Research Excellence in Newborn Medicine is holding an event in partnership with Life's Little Treasures Foundation, to help parents learn more about breathing and lung health, and how best to manage these risks.

Join us for a live question and answer session on the Murdoch Children's Research Institute (MCRI) Facebook page with our experts, Professor Lex Doyle and Dr Brett Manley. Post your questions live during the event or send them through to the MCRI page beforehand.
